

Curriculum intent: Developing resilient and curious mathematicians who see the power and beauty of Mathematics

Literacy/Reading/Oracy opportunities:

		Autumn				Spring				Summer			
Year 7	Autumn	W1	W2	W3	W4	W5	W6	W7	W8	W9	W10	W11	W12
		Making generalisations about the number system 1						Making generalisations about the number system 2					
		Place value Y7U1	Properties of arithmetic Y7U2		Factors and multiples Y7U3		Order of operations Y7U4	Positive and negative numbers Y7U5		Expressions, equations, and inequalities Y7U6			
	Spring	2-D Geometry						The Cartesian plane					
		Angles Y7U7		Classifying 2-D shapes Y7U8		Constructing triangles and quadrilaterals Y7U9		Coordinates Y7U10		Area of 2-D shapes Y7U11		Transforming 2-D figures Y7U12	
		Fractions						Ratio and proportion					
	Summer	Prime factor decomposition Y7U13		Conceptualising and comparing fractions Y7U14		Manipulating and calculating with fractions Y7U15		Ratio Y7U16		Percentages Y7U17			
	Why?	Place Value Students deepen their understanding of the base 10 (decimal) number system using manipulatives and place value grids.				Angles Students develop their understanding of the concept of angles as a measure of turn. Students have an opportunity to practise measuring and drawing angles before				Prime Factorisation After revisiting key ideas including factors, multiples, primes and squares, students are introduced to the Fundamental Theorem of Arithmetic: all integers greater			

	<p>Column addition and subtraction are revisited to reinforce the role of 10.</p> <p><u>Properties of Arithmetic</u> Understanding of the four main operators is checked whilst building on language of arithmetic including sum, product, difference, calculation, operator and operations. Fact families reveal connections between operators. Commutativity is illustrated with arrays and used to simplify calculations. Associativity and distributivity are introduced and used for simplifying calculations. Representations are used throughout to help students to understand and to convince them of the properties. All three properties are used to equip students with a range of mental methods of multiplication.</p> <p><u>Factors and Multiples</u> Students are introduced to factors and multiples in this unit and learn the divisibility rule for 3. They extend their understanding of multiples by finding common multiples of pairs of numbers using number patterns to deepen their understanding. They use bar models to support understanding of factors. Students explore factors pairs of integers and properties of prime and square numbers using arrays to support their understanding. 'Lots of' representations support connections to commutativity and associativity laying foundations for prime factor decomposition.</p>	<p>moving on to applying angle theorems to calculate unknown angles at a point and on a straight line. Intersecting lines and vertically opposite angles are introduced. Students begin the second week by developing their understanding of the properties of parallel lines. This is then developed through the rest of the week to introduce different angle rules involving parallel lines.</p> <p><u>Classifying 2-D Shapes</u> In the first week the focus is on triangles, with students looking at properties including number of equal sides, number of equal angles, types of angles and number of lines of symmetry. Names of polygons with different numbers of sides are revisited from KS2. Students look at a range of properties of quadrilaterals including how many pairs of equal sides, equal angles and parallel sides the shape has. Rotational symmetry is introduced and connections are drawn between the number of sides/angles in a regular polygon, its order of rotational symmetry, and number of lines of symmetry.</p> <p><u>Constructing Triangles and Quadrilaterals</u> This unit starts by looking at the properties of a circle and building understanding of how these properties can be used to construct shapes with equal side lengths. This is developed through the rest of the first week to introduce the approach for constructing Angle-Side-Angle triangles. The second week of this unit starts with more triangle constructions where an</p>	<p>than 1 are either prime or can be written as a product of prime factors in exactly one way. They learn techniques for decomposing numbers into their prime factors and use the prime factor decomposition to find square roots. In the second week, combinations of prime factors are multiplied to generate factors. Venn diagrams are introduced to help identify which prime factors to multiply to generate common factors, the highest common factor and the lowest common multiple.</p> <p><u>Conceptualising and Comparing Fractions</u> In the first week of this unit pupils explore representations of fractions to understand the roles of the numerator and denominator, as well as recognising fractions as the result of a division. Pupils also use reasoned approaches to compare fractions and develop an understanding of equivalent fractions. Equivalence is built on the second week, first by thinking about mixed and improper fractions, then simplest form, and finally decimal conversions.</p> <p><u>Manipulating and Calculating with Fractions</u> The first week of the unit focuses on multiplication with fractions. Pupils understand fractions as operators before using bar models and area models to underpin calculation methods for multiplying with fractions. In the final lesson pupils practise multiplying fractions in the context of developing number sense</p>
--	---	--	--

	<p><u>Order of Operations</u> Students establish equal and unequal priority of the four operations and indices, and understand brackets as a tool to manipulate this order in more complex calculations.</p> <p><u>Positive and Negative Numbers</u> Negative numbers are visited in contexts that students may have experienced in everyday life. Number lines are used to order, compare and add negatives. Addition of negatives is reinforced using two-sided counters. Subtraction and multiplication are explored with negative numbers. The scaling model of multiplication is used to develop the sense of numbers having both direction and magnitude, with negative scalars reversing direction. This model is continued into Week 3 when scalars between -1 and 1 are explored. Multiplication and division with negatives numbers are the continued focus, first looking more deeply at negative scale factors then looking at the inverse of multiplication: division.</p> <p><u>Expressions, Equations and Inequalities</u> Students are formally introduced to some algebraic notation that they will have seen throughout the previous term. Common conventions are introduced. Key representations seen throughout the first term are revisited. Students look are expressions and relational operators (e.g. =, &lt;, &gt;) to introduce equations and inequalities. The maintenance of balance (or equal imbalance) is looked at by</p>	<p>angle and two sides are given. Quadrilateral constructions are then introduced by first giving students circles with equally spaced dots before using compasses. The unit ends with students using their understanding to construct a kite and parallelogram.</p> <p><u>Coordinates</u> Time is spent at the beginning of the first week embedding the fundamental concepts of coordinates: that position is described from the origin and has a horizontal and vertical component. This is formalised when terminology and notation are introduced before deepening understanding by thinking about keeping one coordinate constant. In the second week students focus on lines drawn on grids. Coordinates of points on the graphs of <math>y = x</math> and <math>y = -x</math> are considered before generating coordinate and plotting graphs of lines where a relationship between the <math>x</math> and <math>y</math>-coordinate is described. Gradient is introduced and parallel and perpendicular lines are considered.</p> <p><u>Area and Perimeter of 2D Shapes</u> Pupils are introduced to different forms of measure to represent perimeter and area. They calculate perimeters and areas of different 2-D shapes using reasoned approaches based on grids. They experience varying the dimensions of rectangles to preserve and change area and perimeter. The concept of perpendicular lines is central to finding the area of a parallelogram and triangle, so</p>	<p>of fractional scaling. The second week builds on the foundations of multiplying with fraction from week 1 to develop pupils' understanding of dividing with fractions. Bar models are used to demonstrate equivalences and inverse relationships between <math>\times</math> and <math>\div</math> with fractions to enable pupils to understand and use efficient calculation strategies to divide by fractions. The final week of this unit focuses on addition and subtraction of fractions. Pupils explore common denominators by using pictorial representations to demonstrate the need to denominate fractions in the same way. Efficient calculation approaches are explored through lowest common denominators and adding fractions and decimals.</p> <p><u>Ratio and Proportion</u> Students are introduced to ratios through a pictorial approach which allows them to share a given amount in different ways and examine different mathematical ways of describing the amounts. In the second week students spend their time connecting their understanding of scale factors and the constant of proportionality firstly to enlargements of triangles and then to line segments and part of line segments.</p> <p><u>Percentages</u> This first week of the unit secures the foundations of percentages; how one whole is equivalent to one hundred percent, using number lines, converting between fractions, decimals and</p>
--	--	---	--

	<p>performing the same operation on both sides of the equation or inequality. Learning from the previous two weeks is consolidated through a lens of perimeter problems. The unit ends with students thinking about the generalised form, and comparing counting strategies that could be used to find the nth pattern.</p>	<p>pupils start the second week by examining rectilinear shapes. Pupils use square grids to support reasoning approaches for working out areas of non-rectilinear shapes. The formulae for areas of triangles and parallelograms are then generalised based on exploring how parallelograms can be arranged into rectangles, and triangles as half of parallelograms.</p> <p><u>Transforming 2D Figures</u> Pupils learn how to recognise, describe and perform translations and rotations on shapes. They learn which critical features need to be included in a description of these transformations and this is supported by their understanding of angles and coordinates from earlier units. Pupils formally meet reflection and begin to combine reflections. They use the properties of corresponding points to help them reflect shapes in inclined lines of reflection before seeking equivalence between translations and double reflections in parallel lines of reflection. Enlargement is introduced in the final lesson of the unit.</p>	<p>percentages, before beginning to calculate percentage of amounts. Students are introduced to bearings and consider how to work out and estimate bearings using a number of different representations. Students should build a sense that a bearing and distance describe a position.</p>
<p>How parents / carers can support</p>	<p>Parents can support students in various ways with their progress in Mathematics. The main way is to be encouraging of their efforts and positive about Mathematics in general. Studies have shown that students flourish in Mathematics when parents and carers are positive about the subject themselves.</p>	<p>Parents can support students in various ways with their progress in Mathematics. The main way is to be encouraging of their efforts and positive about Mathematics in general. Studies have shown that students flourish in Mathematics when parents and carers are positive about the subject themselves.</p>	<p>Parents can support students in various ways with their progress in Mathematics. The main way is to be encouraging of their efforts and positive about Mathematics in general. Studies have shown that students flourish in Mathematics when parents and carers are positive about the subject themselves.</p>

	<p>On a practical note, supporting students with their homework and independent revision is extremely helpful.</p> <p>Online help can be found at:</p> <p><a href="#">MathsWatch</a> – this will have homework set for students as well as work they can access independently along with help videos</p>	<p>On a practical note, supporting students with their homework and independent revision is extremely helpful.</p> <p>Online help can be found at:</p> <p><a href="#">MathsWatch</a> – this will have homework set for students as well as work they can access independently along with help videos</p>	<p>On a practical note, supporting students with their homework and independent revision is extremely helpful.</p> <p>Online help can be found at:</p> <p><a href="#">MathsWatch</a> – this will have homework set for students as well as work they can access independently along with help videos</p>

		Autumn				Spring				Summer			
		W1	W2	W3	W4	W5	W6	W7	W8	W9	W10	W11	W12
Year 8	Autumn	Equations and inequalities						Graphical representations					
		Sequences Y8U1		Forming and solving equations Y8U2		Forming and solving inequalities Y8U3		Linear graphs Y8U4		Accuracy and estimation Y8U5			
	Spring	Proportional reasoning						Representations and reasoning with data					
		Ratio review Y8U6	Real life graphs Y8U7		Direct and inverse proportion Y8U8		Univariate data Y8U9		Bivariate data Y8U10				
	Summer	Angles						Area, volume, and surface area					
		Angles in polygons Y8U11			Bearings Y8U12			Circles Y8U13		Volume and surface area of prisms Y8U14			

Why?

Sequences  
Growing patterns are used to emphasise adding the common difference multiple times in order to develop understanding of the *n*th term formula.  
Students find the *n*th term of increasing and decreasing arithmetic sequences as well as quadratic sequences (using diagrams), and using the *n*th term to generate a range of sequences (arithmetic, quadratic and geometric).  
Forming and solving equations

Ratio Review  
Students will look at previously learnt ratio topics, such as equivalence and sharing a quantity in a ratio, before exploring ratio and rates of change.  
Real-life graphs  
Students connect prior learning of linearity and gradient to rates in real life contexts represented graphically.  
Students look at the example of 'rate' – speed in addition to displacement-time graphs.

Angles in polygons  
Students revisit concepts in more depth and look at formal methods for finding the sum of angles in polygon. Lessons focus on issues like 'What is a polygon?' and 'What is an interior angle?'.  
Students continue looking at compounded triangles, and are introduced to methods for finding the sum of interior angles of a polygon. Students also look at alternate methods and again look at what is and isn't an interior angle.  
Students look at interior and exterior angles within regular polygons.

	<p>Students establish the critical features of expressions, equations and identities before using pictorial representations to support the algebraic manipulation in solving simple linear equations. Students develop more versatile algebraic manipulation including solving linear equations with negative coefficients and unknowns on both sides, and applying algebraic reasoning in geometric contexts.</p> <p><u>Forming and solving inequalities</u> Students develop their understanding of inequalities from Year 7 to include number line representations, understanding when inequalities are or are not satisfied, and finding solutions to simple linear inequalities. Students form and solve inequalities based on geometric properties, contexts and pictorial representations, and experience manipulations that do and do not preserve inequality relationships.</p> <p><u>Linear graphs</u> Students visit and revisiting familiar linear graphs in context on the Cartesian plane, such as using coordinates, horizontal and vertical lines (from Year 7 content) and inequalities (previous unit). The focus is on connecting relationships between coordinates to the graphs of linear relationships. Gradient is introduced. The equation of a line is considered in more depth culminating in students moving between the three representations of a linear relationship (coordinates, graph and equation).</p>	<p><u>Direct and inverse proportion</u> Students explore multiplicative relationships and balance, and revisit key concepts such as scale factor and constant of proportionality. Constant of proportionality is focused on as a key concept. Students continue their work with direct proportion and learn methods for finding missing values with non-integer scale factors and constants of proportionality. Students also meet inverse proportion and compare directly and inversely proportional relationships before finding missing values and generalising. Finally, direct and inverse relationships emerge as different parts of <math>\text{speed} \times \text{time} = \text{distance}</math> are held constant.</p> <p><u>Univariate data</u> Students are introduced to the fundamentals of data collection and analysis including question writing, classifying data, collecting data using tally charts, and interpreting data in bar and pie charts.</p> <p><u>Bivariate data</u> Students continue looking at data, but develop learning to bivariate data and are introduced to key representations such as bar models. Students extend their understanding of what bivariate data is, and how it can be represented. Making deductions from the</p>	<p>Opportunities for practice finding missing angles exist throughout the week. Formal angle notation is introduced.</p> <p><u>Bearings</u> Students are introduced to bearings and consider how to work out and estimate bearings using a number of different representations. Students should build a sense that a bearing and distance describe a position. Students continue their work on bearings in new contexts. Firstly, students will formalise the relationship between A from B and B from A, then students will look at how pairs of bearings, and bearings and loci can help find exact positions.</p> <p><u>Circles</u> Students build on their understanding of circles as geometric ‘tools’ for constructing shapes of known side lengths to include calculating circumference and arc lengths. Students extend their understanding of Pi to include being the ratio between the square of a circle’s radius and diameter before calculating area and perimeter of varied sectors and compound shapes.</p> <p><u>Volume and surface area of prisms</u> Students learn the vocabulary to investigate properties of solid shapes. They are challenged to develop their visualisation skills throughout the unit, this week working with 2-D representations and nets. Students are introduced to the idea of a prism. They use their knowledge of nets to</p>
--	---	---	--

	<p><u>Accuracy and estimation</u>  Students use number lines to round to the nearest one, ten, hundred, thousand and to decimal places. They work backwards to see what a rounded number might have been and use rounding to estimate calculations.</p> <p>Students are introduced to significant figures, learning how to round to significant figures, deducing what a rounded number might have been and appreciating why there are different methods of rounding.</p>	<p>data, such as predict non-existent data, find averages, and assessing causality.</p>	<p>identify cross sections and calculate surface area of prisms and cylinders  Students are introduced to the concept of volume. They connect units of measurement to dimensions and learn how to calculate the volume of a prism by multiplying cross-sectional area by length.</p>
<p>How parents / carers can support</p>	<p>Parents can support students in various ways with their progress in Mathematics. The main way is to be encouraging of their efforts and positive about Mathematics in general. Studies have shown that students flourish in Mathematics when parents and carers are positive about the subject themselves.</p> <p>On a practical note, supporting students with their homework and independent revision is extremely helpful.</p>	<p>Parents can support students in various ways with their progress in Mathematics. 	Autumn	Spring	Summer
--	--------	--------	--------

Year 9

Year 9 curriculum map											
	W1	W2	W3	W4	W5	W6	W7	W8	W9	W10	W11
Autumn	Probability						Linear simultaneous equations				
	FDP review Y9U1	Probability Y9U2			Sets, Venns and sample space diagrams Y9U3		Solving algebraically Y9U4			Solving graphically Y9U5	
Spring	Geometry of triangles						Ratio and proportion				
	Angle review Y9U6	Constructions, congruence and loci Y9U7		Pythagoras' Theorem Y9U8		Ratio review Y9U9	Similarity and enlargement Y9U10		Trigonometry Y9U11		
Summer	Quadratics						Reasoning with number				
	Algebra review Y9U12		Quadratic expressions and equations Y9U13				Surds Y9U14	Indices Y9U15		Standard form Y9U16	Growth and decay Y9U19

Why?

<p><u>Fractions, Decimals and percentages</u></p> <p>Students revisit number work from KS2 and KS3 to refresh their understanding of the interconnection of methods of calculation for fractions, decimals and percentage in preparation for work on probability in the next unit</p> <p><u>Probability</u></p> <p>Students are introduced to theoretical probability in a variety of contexts and</p>	<p><u>Angle Review</u></p> <p>Students revisit angle theorems to calculate missing angles using longer chains of reasoning, justifying their deductions. Opportunities exist throughout the unit for estimating, naming, measuring and drawing angles using a protractor.</p>	<p><u>Algebra Review</u></p> <p>In the first of this two week unit, simplification is focused on, firstly by looking at multiplication and division algebraic conventions, then by collecting like terms and finally by expanding a single pair of brackets. Order of operations is key this week. Order of operations is revisited in lesson 1 in the context of evaluating expressions using substitution, in lesson 2 using function machines to write and solve equations, in lesson 3 to solve equations.</p>
--	---	--

	<p>with a variety of representations. Combined events are considered with the use of sample spaces, two-way tables and probability tree diagrams. Students add frequency tree diagrams and two-way tables to their repertoire of probability representations and look at non-random situations. They compare experimental to theoretical probability.</p> <p><u>Sets, Venns and Sample Space Diagrams</u></p> <p>Students build on their existing understanding of Venn diagrams by being introduced to set notation. The second week of this unit builds on the first by introducing probability presented in Venn diagrams and set notation. Students interpret and convert between representations to solve problems.</p> <p><u>Solving Algebraically</u></p> <p>Students work on algebraic manipulation, including some revision of solving linear equations. Students are formally introduced to some formal algebraic manipulation methods such as equation scaling and addition and subtraction of equations within a system. Students solve simultaneous equations by adding or subtracting to remove a variable, firstly looking at cases in which this happens, and then using equivalent equations to manufacture these cases. The focus of this week is solving simultaneous equations through substitution from one equation into another.</p>	<p><u>Constructions, Congruence and Loci</u></p> <p>Students are introduced to loci and use the properties of circles to find the locus of points that are a specific distance from a point. Students develop this to find the locus of points that are equidistant from two points and use this to construct perpendicular bisector. In week 2 of this unit, students are introduced to the conditions for congruence in triangles. This is derived from students understanding of the different ways to construct triangles. These conditions are then used to prove when two triangles are congruent.</p> <p><u>Pythagoras' Theorem</u></p> <p>Students look at tilted squares on squared paper and represent lengths as radicals before looking at how this relates to right-angled triangles leading to a formal introduction to Pythagoras's theorem. Students now start to look at different contexts in which Pythagoras' theorem can be used, such as within 2-D shapes, 3-D shapes, and the Cartesian plane.</p> <p><u>Ratio Review</u></p> <p>Ratio is revisited this week with a focus on understanding the difference between part : part and part : whole relationships, representing those relationships as fractions, using the constant of proportionality and scale factor to find equivalent ratios.</p>	<p><u>Quadratic expressions and equations</u></p> <p>Students look specifically at quadratic expressions and equations, including those written in the standard form <math>ax^2+bx+c(=0)</math>. Students also begin looking at quadratic graphs and common visual features of them, such as the curve and turning point. This week is separated in two halves. In the first two lessons students look at interpreting information from a quadratic graph. In the second half of the week students begin looking at quadratics written in double brackets. Students continue to work on expanding brackets, as the questions gradually increase in complexity, They eventually move onto expanding more than two brackets. The final lesson of the unit compares different representations of brackets.</p> <p><u>Surds</u></p> <p>Students are introduced to rational and irrational numbers, and surds. This unit can be thought of as "surds-lite" as students will be introduced to surds in a way that is key stage appropriate.</p> <p><u>Indices</u></p> <p>During the first week of this unit students look at indices and roots, including looking at cases with negative indices and an index of zero. This week focusses on the index laws, looking at multiplication, division, and raising to further powers. The final</p>
--	---	---	--

	<p><u>Solving Graphically</u></p> <p>Students explore linear graphs to connect understanding of solutions to linear equations in two variables to the coordinates of points that lie on their graphs, including intersections as simultaneous equations. Venn diagrams are presented as ways of capturing experimental data. Students then calculate experimental probability from information in Venn diagrams using set notation.</p>	<p><u>Similarity and Enlargement</u></p> <p>Students are introduced to the idea of similarity in the context of enlargement. They use, then learn, how to find the scale factor from the unit ratio. After working with inter-shape relationships, they revisit the idea of constants of proportionality. Students' attention is drawn to the similarities and differences of intra shape and inter shape relationships. They are introduced to the centre of enlargement firstly through examining enlarged shapes and their relationship to the centre.</p> <p><u>Trigonometry</u></p> <p>Students investigate a right-angled triangle in a unit circle in quadrant 1 and use what is known about similar shapes to find missing lengths of right-angled triangles. After being introduced to sine and cosine functions. Two key ideas are explored this week. Firstly, the relationship between the opposite and adjacent is looked at as the tangent of an angle is uncovered. Secondly, students look at finding unknown angles through inverse trig functions.</p>	<p>lesson asks students to apply these three laws to more complex examples.</p> <p><u>Standard Form</u></p> <p>Students are introduced to numbers written in standard form as tools to consider and compare very large and very small numbers. They draw connections between powers of ten and place value, compare the size of numbers by considering the power of ten.</p>
<p>How parents / carers can support</p>	<p>Parents can support students in various ways with their progress in Mathematics. The main way is to be encouraging of their efforts and positive about Mathematics in general. Studies have shown that students flourish in Mathematics when parents and carers are positive about the subject themselves.</p>	<p>Parents can support students in various ways with their progress in Mathematics. The main way is to be encouraging of their efforts and positive about Mathematics in general. --	--	---	---

- Write 51080 in standard form.
- Write  $3.74 \times 10^{-6}$  as an ordinary number.
- Simplify  $\sqrt{8}$ .
- Convert a 'near miss', or any number, into standard form; e.g.  $23 \times 10^7$ .
- Simplify  $4p - 2q^2 + 1 - 3p + 5q^2$ .
- Evaluate  $4x^2 - 2x$  when  $x = -5$ .
- Simplify  $z^4 \times z^3$ ,  $y^3 \div y^2$ ,  $(a^7)^2$ ,  $(8x^6y^4)^{\frac{1}{3}}$ .
- Expand and simplify  $3(t - 1) + 57$ .
- Factorise  $15x^2y - 35x^2y^2$ .
- Expand and simplify  $(3x + 2)(4x - 1)$ .
- Factorise  $6x^2 - 7x + 1$ .
- A room is 2 m longer than it is wide. If its area is  $30 \text{ m}^2$  what is its perimeter?
- Use fractions when working in algebraic situations.
- Substitute positive and negative numbers into formulae.
- Be aware of common scientific formulae.
- Know the meaning of the 'subject' of a formula.
- Change the subject of a formula when one step is required.
- Change the subject of a formula when two steps are required.
- Given a sequence, 'which is the 1st term greater than 50?'

- Understand, from the experience of constructing them, that triangles satisfying SSS, SAS, ASA and RHS are unique, but SSA triangles are not.
- Match the characteristic shape of the graphs to their functions and transformations.
- Find the area of a segment of a circle given the radius and length of the chord.
- Justify when to use the cosine rule, sine rule, Pythagoras' Theorem or normal trigonometric ratios to solve problems.

	<ul style="list-style-type: none"><li>• Be able to solve problems involving sequences from real-life situations, such as:<ul style="list-style-type: none"><li>○ 1 grain of rice on first square, 2 grains on second, 4 grains on third, etc (geometric progression), or person saves £10 one week, £20 the next, £30 the next, etc;</li><li>○ What is the amount of money after <math>x</math> months saving the same amount, or the height of tree that grows 6 m per year;</li><li>○ Compare two pocket money options, e.g. same number of £ per week as your age from 5 until 21, or starting with £5 a week aged 5 and increasing by 15% a year until 21.</li></ul></li><li>• Convert a fraction to a decimal including where the fraction is greater than 1.</li><li>• Be able to work out the price of a deposit, given the price of a sofa is £480 and the deposit is 15% of the price, without a calculator.</li><li>• Find fractional percentages of amounts, with and without using a calculator.</li></ul>

- Write 51 080 in standard form.
- Write  $3.74 \times 10^{-6}$  as an ordinary number.
- What is  $9^0$ ?

Higher

- Explain why a sample may not be representative of a whole population.
- Carry out their own statistical investigation and justify how sources of bias have been eliminated.
- Construct cumulative frequency graphs, box plots and histograms from frequency tables.
- Compare two data sets and justify their comparisons based on measures extracted from their diagrams where appropriate in terms of the context of the data.
- Expand  $x(x - 1)(x + 2)$ .
- Expand  $(x - 1)^3$ .
- Expand  $(x + 1)(x + 2)(x - 1)$ .
- Sketch  $y = (x + 1)^2(x - 2)$ .
- Interpret a pair of simultaneous equations as a pair of straight lines and their solution as the point of intersection.
- Be able to state the solution set of  $x^2 - 3x - 10 < 0$  as  $\{x: x < -3\} \cup \{x: x > 5\}$ .
- Justify clearly missing angles on diagrams using the various circle theorems.

- Add and subtract vectors algebraically and use column vectors.
- Solve geometric problems and produce proofs.
- Explain why you cannot find the area under a reciprocal or tan graph.
- Understand that when two quantities are in direct proportion, the ratio between them remains constant.
- Know the symbol for 'is proportional to'.
- Rationalise:  $\frac{1}{\sqrt{3}-1}$ ,  $\frac{1}{\sqrt{3}}$ ,  $(\sqrt{18} + 10) + \sqrt{2}$ .
- Explain the difference between rational and irrational numbers.
- Given a function, evaluate  $f(2)$ .
- When  $g(x) = 3 - 2x$ , find  $g^{-1}(x)$ .

	<ul style="list-style-type: none"> <li>Justify if a straight-line graph would pass through a circle drawn on a coordinate grid.</li> </ul>
